How to Get the UGC Skills

A step-by-step guide for complete beginners. If you have never used GitHub, a terminal, or written a line of code, this is written for you. Follow it in order and nothing will be assumed.

No coding needed | No GitHub account needed | ~20 minutes

First, three words explained

You will see these words a lot. Here is all they mean, in plain English.

GitHub
A website where people store and share files of code. Think of it like Google Drive, but made for programs instead of documents.

Repository (or "repo")
One project's folder on GitHub. Ours is the folder of UGC skills. A repo is just a named box of files you can look at or copy.

Download / clone
Copying that folder from the website onto your own computer so you can use it. We will use the simplest way: a plain download.

The whole plan in one line: download the folder → run one setup command → then just talk to Claude and it makes videos. That is it.

PART A

Get the files onto your computer

You do not need a GitHub account for this. You are only downloading a folder, like downloading any file from the internet.

1 Open the link in your web browser

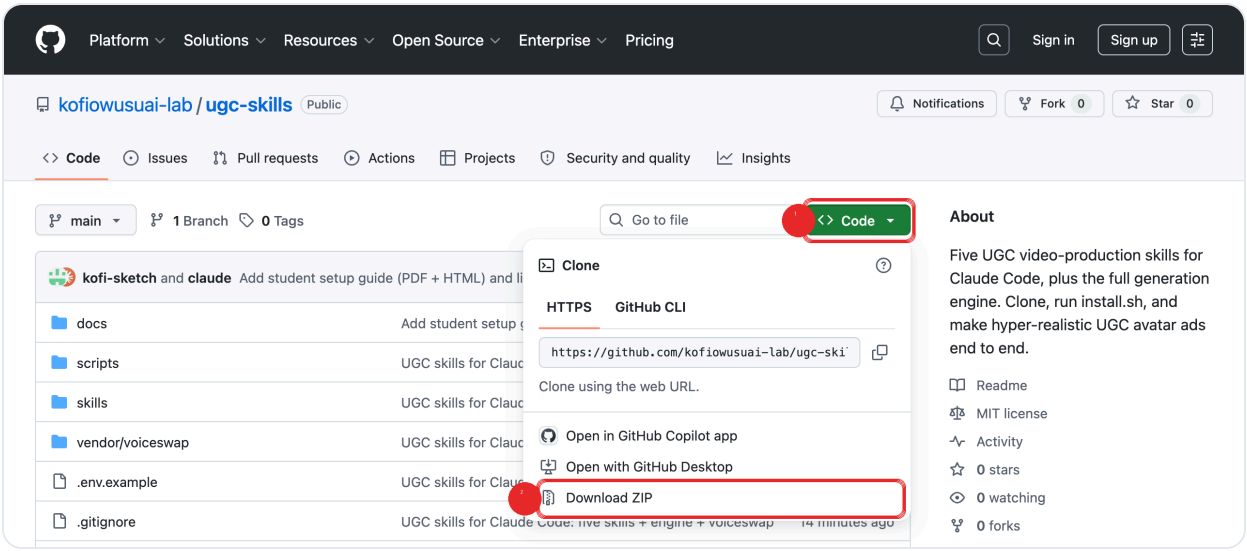

Type or click this address. Any browser works (Chrome, Safari, Edge):

```
https://github.com/kofiowusuai-lab/ugc-skills
```

You will land on the page shown below. It looks busy, but you only need two buttons on it.

2 Click the green "Code" button, then "Download ZIP"

Find the green **Code** button on the right (marked **1** below). Click it. A small menu opens. At the bottom of that menu, click **Download ZIP** (marked **2**).

Click the green **Code** button (1), then **Download ZIP** (2) at the bottom of the menu.

3 Unzip the file you downloaded

A file called `ugc-skills-main.zip` lands in your **Downloads** folder. Double-click it. It turns into a normal folder named `ugc-skills-main`. That folder holds all the skills. Leave it in Downloads for now, or drag it to your Desktop so it is easy to find.

Done with Part A. The files are now on your computer. The rest is a one-time setup so Claude can see them.

PART B

Open the Terminal

The Terminal is a plain app already on your computer where you type commands instead of clicking. It looks bare, but you will only paste a few lines. Nothing here can break your computer.

MAC

Open Terminal

Press `Command (⌘)` and `Space` together. A search box appears. Type **Terminal** and press `Return`. A small window opens. That is it.

WINDOWS

Open Git Bash

Install **Git for Windows** from `git-scm.com` (click through the installer with the default options). Then open the Start menu, type **Git Bash**, and click it. Use that window for the steps below.

Tip: keep this Terminal window open for all of Part C. If you close it, just open it again the same way.

PART C

Set it up (one time)

Four short steps. For each one, copy the line, paste it into the Terminal, and press `Return`. To paste in Terminal, use `Command+V` on Mac (right-click on Windows).

1

Go into the folder

Type the word `cd` and one space, but do **not** press Return yet. Then drag the `ugc-skills-main` folder from your Desktop (or Downloads) and drop it right onto the Terminal window. It fills in the location for you. Now press `Return`.

```
# after the drag, your line will look something like this:
cd /Users/you/Desktop/ugc-skills-main
```

2

Run the installer

This copies the skills into the right place for Claude. Paste this and press Return:

```
bash install.sh
```

You will see a few lines of text scroll by. When it stops and shows the setup notes, it worked.

3 Add your keys

The skills use paid services (for voices and video). You paste your keys into a small settings file. First make the file:

```
cp .env.example .env
```

Open the new `.env` file (on Mac, run `open .env`; on Windows, open it from the folder in Notepad), paste your keys after the equals signs, and save. Then load it:

```
set -a; . ./.env; set +a
```

4 Install the helper pieces

One last line downloads the small tools the skills use:

```
python3 -m pip install -r requirements.txt
```

Setup finished. You never have to do Part B or C again. From now on you just open Claude and ask.

PART D

Use it

Open Claude Code and type `/`. You should see the `ugc-` skills appear in the list. You do not need to remember any commands. Just describe what you want, like this:

```
you type:
make a 6-second UGC clip of a woman in a kitchen saying
"honestly this changed how I meal prep" using the brittney voice
```

Claude takes over from there: it plans the shot, generates the video, adds the voice, and hands you a finished clip. Start with short clips while you learn, then ask for full ads once you are comfortable.

> **A note on cost:** the voice and video services charge a small amount each time you generate. Begin with one short clip to confirm everything works before you make a batch.

If something goes wrong

WHAT YOU SEE	WHAT TO DO
The skills do not appear in Claude	Close Claude Code and open it again so it re-reads the skills folder.
`command not found`	You may have missed a word when pasting. Copy the whole line again exactly.
A message about a missing "key"	Run this line again in the same window: `set -a; . ./.env; set +a`
You closed the Terminal	Open it again (Part B) and run the `cd` drag step again before your commands.
Still stuck	Read `README.md` inside the folder, or ask in the Academy group. Copy the exact red error text so someone can help fast.

Words you will hear

WORD	PLAIN MEANING
Repo	A project folder on GitHub. Ours holds the UGC skills.
Clone / download	Making your own copy of that folder on your computer.
Terminal	The app where you type commands instead of clicking buttons.
Install	Setting the files up so a program (Claude) can use them.
Skill	An ability you add to Claude. Here, making UGC videos.
API key	A password-like code that lets the tools use a paid service on your behalf.
